

## **Moons of Jupiter**

Torrence V. Johnson, Jet Propulsion Laboratory, Caltech, Pasadena, CA 91109

The four Galilean moons of Jupiter have played an important role in the history of astronomy and planetary science, from Galileo's initial discovery in 1610 to the results of the Galileo mission over the last four years. This talk will review the current state of knowledge of the Galilean satellites, including the most recent results from the Galileo Millennium Mission Europa and Io encounters.
